The problem is considered of computing the transient response of the telegraph equation. For the special case without losses a simple representation was obtained that readily permits calculation of the "output" at any station at any preselected time. In the general case the exact result is given in terms of the sum of Bessel functions. For engineering purposes this sum is approximated by a simpler expression which yields satisfactory results.

DESCRIPTORS: *Carbohydrates, Crystallization,
*Purification, Ion exchange, Quality control, Liquids,
Bleaching.

The invention involves a procedure for processing of
filtrates of the sugar cristallization, characterized in
as much that filtrates, which can not be reduced any
more to white sugar quality can be conducted through
processing, according to well known salt removing
